# Physics DPP

DPP-1 calorimetry

**By Physicsaholics Team**

Q) If specific heat of a substance is infinite, it means--

- (A) Heat is given out
- (B) Heat is taken in
- (C) No change in temperature takes place whether heat is taken in or given out
- (D) All of the above

**Join Unacademy PLUS Referral Code :**

**Physicslive**

Ans. c

$$Q = m c \Delta\theta \Rightarrow c = \frac{Q}{m \Delta\theta} ; \text{when } \Delta\theta = 0 \Rightarrow c = \infty$$

Q) Two spheres made of same substance have diameters in the ratio 1 : 2. Their thermal capacities are in the ratio of -

(A) 1 : 2

(B) 1 : 8

(C) 1 : 4

(D) 2 : 1

**Join Unacademy PLUS Referral Code :**

**Physicslive**

Ans. b

Two spheres made of same substance have diameters in the ratio 1 : 2. Their thermal capacities are in the ratio of -

formula for heat capacity  $\Rightarrow ms$

$$\Rightarrow \rho \times \frac{4}{3} \pi R^3 \cdot s$$

$$\Rightarrow H.C \propto R^3$$

$$\Rightarrow \frac{(H.C)_1}{(H.C)_2} = \frac{1}{8}$$

Q) Liquids A and B are at  $30^{\circ}\text{C}$  and  $20^{\circ}\text{C}$ . When mixed in equal masses, the temperature of the mixture is found to be  $26^{\circ}\text{C}$ . Their specific heats are in the ratio of -

(a) 3 : 2

(B) 1 : 1

(C) 2 : 3

(D) 4 : 3

**Join Unacademy PLUS Referral Code :**

**Physicslive**

Ans. a

Liquids A and B are at 30°C and 20°C. When mixed in equal masses, the temperature of the mixture is found to be 26°C. Their specific heats are in the ratio of -

Heat given = Heat taken

$$m S_A (30 - 26) = m S_B (26 - 20)$$

$$\frac{S_A}{S_B} = \frac{4}{3} = 3 : 2$$

Q) The temperature of equal masses of three different liquids A, B and C are  $12^{\circ}\text{C}$ ,  $19^{\circ}\text{C}$  and  $28^{\circ}\text{C}$  respectively . The temperature when A and B are mixed is  $16^{\circ}\text{C}$ , when B and C are mixed is  $23^{\circ}\text{C}$ ; what is the temperature when A and C are mixed ?

(A)  $31^{\circ}\text{C}$

(B)  $20.26^{\circ}\text{C}$

(C)  $19.5^{\circ}\text{C}$

(D)  $28^{\circ}\text{C}$

**Join Unacademy PLUS Referral Code :**

**Physicslive**

Ans.b

Let  $m$  be the mass of each liquid and  $S_A, S_B, S_C$  be specific heats of liquids  $A, B$  and  $C$  respectively. When  $A$  and  $B$  are mixed. The final temperature is  $16^\circ C$ .

$\therefore$  Heat gained by  $A$  = heat lost by  $B$

$$\text{i.e., } mS_A = (16 - 12) = mS_B(19 - 16)$$

$$\text{i.e., } S_B = \frac{4}{3}S_A \dots (i)$$

When  $B$  and  $C$  are mixed. Heat gained by  $B$  = Heat lost by  $C$

$$\text{i.e., } mS_B = (23 - 19) = mS_C(28 - 23)$$

$$\text{i.e., } S_C = \frac{4}{5}S_B \dots (ii)$$

From eq. (i) and (ii)

$$S_C = \frac{4}{5} \times \frac{4}{3}S_A = \frac{16}{15}S_A$$

When  $A$  and  $C$  are mixed, let the final temperature be  $\theta$

$$\therefore mS_A(\theta - 12) = mS_C(28 - \theta)$$

$$\text{i.e., } \theta - 12 = \frac{16}{15}(28 - \theta)$$

By solving, we get,

$$\theta = \frac{628}{31} = 20.26^\circ C.$$

Q) Heat required to convert one gram of ice at  $0^{\circ}\text{C}$  into steam at  $100^{\circ}\text{C}$  is (given  $L_{\text{steam}} = 536 \text{ cal/gm}$ )-

- (A) 100 calorie      (B) 0.01 kilocalorie  
(C) 716 calorie      (D) 1 kilocalorie

**Join Unacademy PLUS Referral Code :**

**Physicslive**

Ans. c

Mass of ice = 1 g

Temperature of ice = 0 °C

- The ice at 0°C is needed to convert to water at the same temperature i.e. 0°C

Heat required at this stage

= Mass of the ice x Latent heat of fusion of ice

$$= 1 \times 80 = 80 \text{ cal}$$

- Now increase the water temperature from 0°C to 100°C by using the formula.

Heat required = Mass of water x rise in temperature x specific heat of water

$$= 1 \times 100 \times 1 = 100 \text{ cal}$$

- Now convert water into vapour state at 100°C

Heat required for this

= Mass of water x Latent heat

$$= 1 \times 536 = 536 \text{ cal}$$

Total heat required

$$= 80 + 100 + 536 = 716 \text{ cal}$$

Q) 300 gm of water at  $25^{\circ}\text{C}$  is added to 100 gm of ice at  $0^{\circ}\text{C}$ . The final temperature of the mixture is - :-

(A)  $0^{\circ}\text{C}$

(B)  $2^{\circ}\text{C}$

(C)  $1^{\circ}\text{C}$

(D)  $3^{\circ}\text{C}$

**Join Unacademy PLUS Referral Code :**

**Physicslive**

Ans. a

We know that latent heat of fusion of ice is 79.7 Cal per gram.

Let final temperature be  $T$ .

Then

$$m_1 S \Delta T = m_2 L$$

$$300 \times 1 \times (25 - T) = 100 \times 75$$

$$(25 - T) = \frac{100 \times 75}{300}$$

$$25 - T = 25$$

$$T = 0^\circ\text{C}$$

After that total energy left =  $4.7 \times 100$

Total mass of water = 400 g

Amount of water again converted into ice

$$m = \frac{470}{79.7}$$

$$m = 5.9 \text{ g}$$

Thus whole mass is converted into water at  $0^\circ\text{C}$ , and about 5.9 g water is again converted into ice whose temperature is also  $0^\circ\text{C}$ .

After achieving the temperature of  $0^\circ\text{C}$ , latent heat of fusion is required firstly for conversion of water into ice then further lowering of temperature is possible. So the final temperature will be  $0^\circ\text{C}$ .

Q) A 1 g of ice is mixed with 1 g of steam. After thermal equilibrium is achieved, the temperature of the mixture is : -

A)  $100^{\circ}\text{C}$   
(C)  $75^{\circ}\text{C}$

(B)  $55^{\circ}\text{C}$   
(D)  $0^{\circ}\text{C}$

**Join Unacademy PLUS Referral Code :**

**Physicslive**

Ans. a

Total heat gained by ice is equal to the total heat lost by steam.

For ice to completely convert into water, heat required is  $m_1 L_f = 1 \times 80 = 80 \text{ cal}$

For steam to completely convert into water, heat released is  $m_2 L_v = 1 \times 540 = 540 \text{ cal}$

Hence, first 80 calories will not be enough for the steam to condense completely.

Now, to convert melted water to  $100^\circ\text{C}$  from  $0^\circ\text{C}$ , heat required is  $m_1 s(100 - 0) = 1 \times 1 \times 100 = 100 \text{ cal}$

So, total energy required to heat ice to water  $100^\circ\text{C}$  is  $100 + 80 = 180 \text{ cal}$ .

Hence, even this amount of energy is not enough for the steam to condense completely. Hence, the final temperature of the mixture will be  $100^\circ\text{C}$ .

Note- finally the mixture will consist of both steam and water at  $100^\circ\text{C}$ .

Q) If  $x$  grams of steam at  $100^{\circ}\text{C}$  becomes water at  $100^{\circ}\text{C}$  which converts  $y$  grams of ice at  $0^{\circ}\text{C}$  into water at  $100^{\circ}\text{C}$ , then the ratio  $x/y$  will be –

(A)  $1/3$

(B)  $1/2$

(C)  $1/4$

(D) none

**Join Unacademy PLUS Referral Code :**

**Physicslive**

Ans. a

If  $x$  grams of steam at  $100^{\circ}\text{C}$  becomes water at  $100^{\circ}\text{C}$  which converts  $y$  grams of ice at  $0^{\circ}\text{C}$  into water at  $100^{\circ}\text{C}$ , then the ratio  $x/y$  will be –

Heat released by steam = Heat taken by ice  
 $x$  gms  $y$  gms

$$x \cdot L_{\text{steam}} = y \cdot L_{\text{ice}} + y S_w \Delta T$$

$$x \cdot 540 = y \cdot 80 + y \cdot 1 \cdot 100$$

$$x \cdot 540 = 180 y$$

$$x/y = 1:3$$

Q) 5 g of steam at  $100^{\circ}\text{C}$  is passed into 6 g of ice at  $0^{\circ}\text{C}$ . If the latent heats of steam and ice are  $540\text{ cal/g}$  and  $80\text{ cal/g}$ , then the final temperature is—

(A)  $0^{\circ}\text{C}$

(B)  $50^{\circ}\text{C}$

(C)  $30^{\circ}\text{C}$

(D)  $100^{\circ}\text{C}$

**Join Unacademy PLUS Referral Code :**

**Physicslive**

Ans. d

Total heat gained by ice is equal to the total heat lost by steam.

For ice to completely convert into water, heat required is  $m_1 L_f = 1 \times 80 = 80 \text{ cal}$

For steam to completely convert into water, heat released is  $m_2 L_v = 1 \times 540 = 540 \text{ cal}$

Hence, first 80 calories will not be enough for the steam to condense completely.

Now, to convert melted water to  $100^\circ\text{C}$  from  $0^\circ\text{C}$ , heat required is  $m_1 s(100 - 0) = 1 \times 1 \times 100 = 100 \text{ cal}$

So, total energy required to heat ice to water  $100^\circ\text{C}$  is  $100 + 80 = 180 \text{ cal}$ .

Hence, even this amount of energy is not enough for the steam to condense completely. Hence, the final temperature of the mixture will be  $100^\circ\text{C}$ .

Note- finally the mixture will consist of both steam and water at  $100^\circ\text{C}$ .

Q) The amount of heat required to raise the temperature of 1 kg of water through  $1^{\circ}\text{C}$  is called

- (A) kilocalorie      (B) calorie  
(C) B.T.U.          (D) calorie/ $^{\circ}\text{C}$

**Join Unacademy PLUS Referral Code :**

**Physicslive**

Ans. a

The amount of heat required to raise the temperature of 1 kg of water through  $1^{\circ}\text{C}$  is called

$$\rightarrow Q = m \Delta T$$
$$= 1000 \text{ gm} \times \frac{1 \text{ cal}}{\text{gm}^{\circ}\text{C}} \times 1^{\circ}\text{C}$$

$$= 1000 \text{ cal} = 1 \text{ Kcal}$$
