# Physics DPP

**DPP- 2 Calorimetry**

**By Physicsaholics Team**

Q) Ice at  $0^{\circ}\text{C}$  is added to 200gm of water initially at  $70^{\circ}\text{C}$  in a vacuum flask. When 50 gm of ice has been added and has all melted, the temperature of flask and contents is  $40^{\circ}\text{C}$ , When a further 80 gm of ice is added and has all melted, the temperature of whole becomes  $10^{\circ}\text{C}$ . Neglecting heat lost to surroundings the latent heat of fusion of ice is :  
(The specific heat of water is = 1 calorie/gram  $^{\circ}\text{C}$ )

(A) 80 cal/gm

(C) 90 cal/gm

(B) 70 cal/gm

(D) 540 cal/gm

**Join Unacademy PLUS Referral Code :**

**Physicslive**

Ans. C

Let latent heat of fusion of ice =  $L$

+ heat capacity of flask =  $C$   
s.p.

mass of flask =  $m$ .

given; specific heat capacity of water =  $1 \text{ cal/g-}^\circ\text{C}$

Now; when 50 gm of ice at  $0^\circ\text{C}$  is mixed

final temp =  $40^\circ\text{C}$ .

$$\therefore 50 \times L + 50 \times 1 \times (40 - 0) = 200 \times 1 \times (70 - 40) + mC(70 - 40)$$

$$50L + 2000 = 6000 + 30mC$$

$$\boxed{50L = 4000 + 30mC} \quad \text{--- ①}$$

New total mass of water =  $200 + 50$   
 $= 250 \text{ gm.}$

Now; when 80 gm of ice at  $0^\circ\text{C}$  is mixed  
final temperature =  $10^\circ\text{C}$

$$\therefore 80 \times L + 80 \times 1 \times (10 - 0) = 250 \times 1 \times (40 - 10) + mC(40 - 10)$$

$$80L + 800 = 7500 + 30mC$$

$$\boxed{80L = 6700 + 30mC} \quad \text{--- ②}$$

$$\text{②} - \text{①} \Rightarrow 30L = 2700 + 0$$

$$L = \frac{2700}{30}$$

$$\boxed{L = 90 \text{ cal/gm.}}$$

Q) Water of volume 2 litre in a container is heated with a coil of 1 kW at  $27^{\circ}\text{C}$ . The lid of the container is open and energy dissipates at rate of 160 J/s. In how much time temperature will rise from  $27^{\circ}\text{C}$  to  $77^{\circ}\text{C}$  ?

[Given specific heat of water is  $4.2 \text{ kJ/K}\cdot\text{kg}$ ]

(A) 8 min 20 s

(C) 6 min 2 s

(B) 7 min

(D) 14 min

**Join Unacademy PLUS Referral Code :**

**Physicslive**

Ans. a

Energy require to rise the temperature from  $27^\circ\text{C}$  to  $77^\circ\text{C} = Q$

$$\begin{aligned} Q &= m s \Delta T \\ &= (\rho V) s \Delta T \\ &= (1000 \times (2 \times 10^{-3})) \times 4.2 \times 10^3 \times (77 - 27) \end{aligned}$$

$$\left[ \begin{aligned} \because \rho_w &= 1000 \text{ kg/m}^3 \\ \text{1 L} &= 10^{-3} \text{ m}^3 \end{aligned} \right]$$

$$\begin{aligned} \Rightarrow Q &= 2 \times 4.2 \times 10^3 \times 50 \\ Q &= 420 \times 10^3 \text{ J.} \end{aligned}$$

Power of heating coil =  $1 \text{ kW}$   
 $= 10^3 \text{ J/s} = 1000 \text{ J/sec}$

rate of energy dissipation =  $160 \text{ J/s}$

$$\begin{aligned} \therefore \text{rate of energy used to rise temp of water} &= 1000 - 160 \\ &= 840 \text{ J/s.} \end{aligned}$$

$$\therefore t = \frac{420 \times 10^3}{840}$$

$$t = \frac{10^3}{2} = \frac{1000}{2} = 500 \text{ sec}$$

$$t = \frac{500}{60} = \frac{50}{6} \text{ min,}$$

$$t = \frac{48}{6} + \frac{2}{6} = 8 \text{ min} + \frac{2}{6} \text{ min}$$

$$t = 8 \text{ min} + \frac{2}{6} \times 60 \text{ sec}$$

$$\boxed{t = 8 \text{ min } 20 \text{ sec}}$$

Q) 2 kg ice at  $-20^{\circ}\text{C}$  is mixed with 5 kg water at  $20^{\circ}\text{C}$  in an insulating vessel having negligible heat capacity. Calculate the final mass of water remaining in container.

Given sp. heat water =  $4.186 \text{ kJ K}^{-1} \text{ kg}^{-1}$

sp. heat Ice =  $2.092 \text{ kJ K}^{-1} \text{ kg}^{-1}$

Latent heat of fusion of ice =  $334.7 \text{ kJ kg}^{-1}$

(A) 7 kg

(C) 6 kg

(B) 4 kg

(D) 2 kg

**Join Unacademy PLUS Referral Code :**

**Physicslive**

Ans. C

ice	water
2 kg	5 kg
at $-20^{\circ}\text{C}$	at $20^{\circ}\text{C}$
$S_i = 2.092 \text{ kJ/kg}\cdot\text{K}$	$S_w = 4.186 \text{ kJ/kg}\cdot\text{K}$
$L = 334.7 \text{ kJ/kg}$	

heat required to take ice from  $-20^{\circ}\text{C}$   
to ice at  $0^{\circ}\text{C}$

$$Q_1 = 2 \times (2.092) \times (20) = 83.68 \text{ kJ}$$

heat released in taking water from  
 $20^{\circ}\text{C}$  to water at  $0^{\circ}\text{C}$

$$Q_2 = 5 \times 4.186 \times (20) = 418.6 \text{ kJ}$$

$$\begin{aligned}\text{Excess heat remaining} &= 418.6 - 83.68 \\ &= 334.9 \text{ kJ}\end{aligned}$$

this heat will convert ice into water  
let  $m$  mass of ice is melted  
to  $0^{\circ}\text{C}$  water

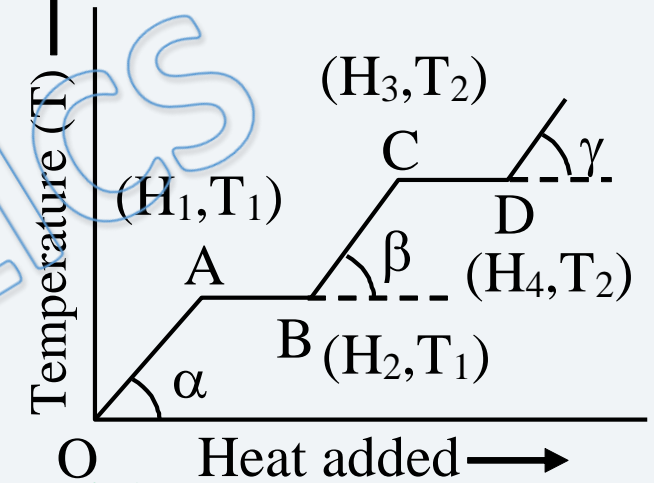

$$m \times 334.7 = 334.9$$

$$m \approx 1 \text{ kg}$$

$$\therefore \text{New Total mass of water} = 5 + 1$$

$\text{Total mass of water} = 6 \text{ kg}$

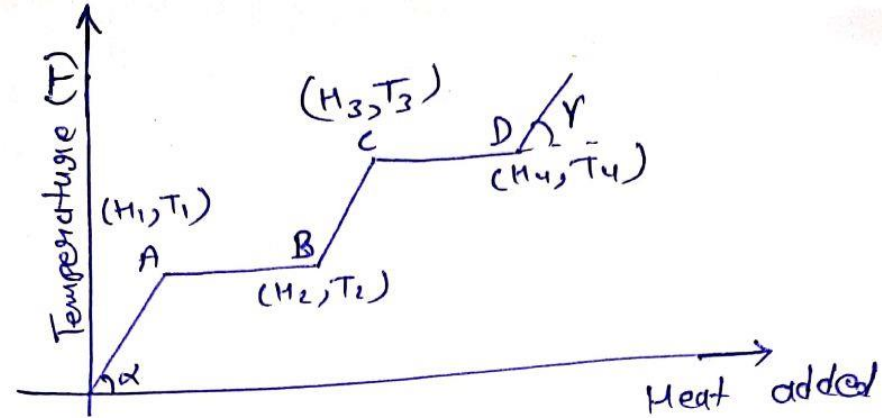

Q) The accompanying graph shows the variation of temperature ( $T$ ) of one kilogram material with Heat ( $H$ ) supplied to it. At O, the substance is in solid state. Which of the following interpretation from the graph is correct –

- (A)  $T_2$  is the melting point of the solid
- (B) BC represents the change of state from solid to liquid.
- (C)  $(H_2 - H_1)$  represent the latent heat of fusion of the substance.
- (D)  $(H_3 - H_1)$  represents the latent heat of vaporisation of the liquid.

Ans. C

$O \rightarrow A$

Temperature is increasing.

at 'O'  $\rightarrow$  substance is solid

so 'OA'  $\Rightarrow$  substance is solid and  
is temperature is increasing to  $T_1$

AB  $\Rightarrow$  Temperature is constant

[When substance will change its state

from solid to liquid]

at A  $\rightarrow$  solid

B  $\rightarrow$  complete liquid

$\therefore AB \Rightarrow H_2 - H_1 = \text{latent heat of fusion.}$

BC  $\Rightarrow$  Temperature increasing in liquid state

CD  $\rightarrow$  substance is vaporizing

**Q)** Steam at  $100^{\circ}\text{C}$  is passed into 1.1 kg of water contained in a calorimeter of water equivalent 0.02 kg at  $15^{\circ}\text{C}$ , till the temperature of the calorimeter and its contents rises to  $80^{\circ}\text{C}$ . The mass of steam condensed (in kg) is (Take latent heat of steam =  $540 \text{ cal g}^{-1}$ , sp. Heat of water =  $4.2 \text{ kJ K}^{-1} \text{ kg}^{-1}$ ) :

(A) 0.13

(C) 0.065

(B) 0.26

(D) 0.135

**Join Unacademy PLUS Referral Code :**

**Physicslive**

Ans. A

$$\text{water equivalent of Calorimeter} = 0.02 \text{ kg}$$

$$\begin{aligned}\text{So, The mass of water \& the} \\ \text{calorimeter} &= (1.1 + 0.02) \\ &= 1.12 \text{ kg}\end{aligned}$$

$$\text{Specific heat capacity of water} = 4.2 \times 10^3 \text{ kJ/kg-K}$$

Heat gained by calorimeter + water is

$$Q = 1.12 \times (4.2 \times 10^3) \times 65$$

$$Q = 305.76 \text{ kJ or } \frac{305.76}{4.2} = 72.8 \text{ kcal}$$

Let mass of steam condensed =  $m$

$$m \times 1 \times 20 + m \times 540 = 72.8 \times 10^3 \text{ cal}$$

$$m = \frac{72.8}{560} \times 10^3$$

$$m = 0.13 \times 10^3 \text{ gm}$$

$$\boxed{m = 0.13 \text{ kg}}$$

Q) When 10 gm of ice at  $-20^{\circ}\text{C}$  is mixed with 10 gm of water at  $50^{\circ}\text{C}$ , the amount of ice melted is –

The latent heat of fusion for ice is  $80\text{ cal/gm}$ , The specific heat of ice is  $0.5\text{ cal/gm}^{\circ}\text{C}$ , The specific heat of water is  $1\text{ cal/gm}^{\circ}\text{C}$

(A) 2 gm

(B) 4 gm

(C) 3 gm

(D) 5 gm

**Join Unacademy PLUS Referral Code :**

**Physicslive**

Ans. D

heat gained by ice to melt in water at  $0^{\circ}\text{C}$

$$Q_1 = 10 \times 0.5 \times 20 + 10 \times 80$$

$$Q_1 = 500 \text{ J.}$$

heat released by water if it is  
taken to  $0^{\circ}\text{C}$  water

$$Q_2 = 50 \times 1 \times (50 - 0) = 2500 \text{ J.}$$

$\therefore Q_1 > Q_2$   
means all ice will not melt.

$\therefore$  Let mass of ice melt =  $m$  (in gms)

$$\text{So, } 10 \times 0.5 \times 20 + m \times 80 = 500$$

$$100 + m \times 80 = 500$$

$$m = \frac{400}{80}$$

$$\boxed{m = 5 \text{ gm}}$$

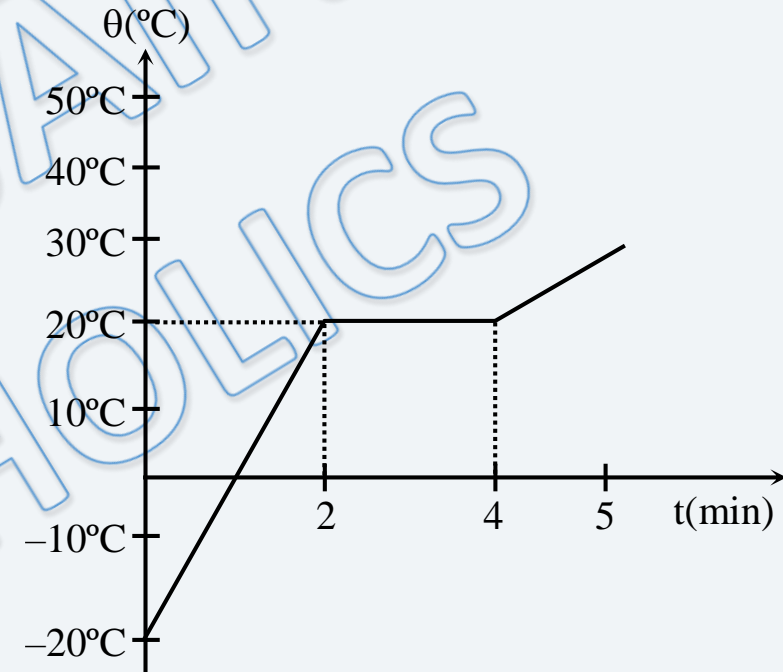

Q) Heat is supplied to 2kg of solid (initially at  $-20^{\circ}\text{C}$ ) at the constant rate of  $5\text{kJ/min}$ . Temperature is plotted as a function of time as shown in the figure. Latent heat of fusion for solid is -

(A)  $10\text{ kJ/kg}$

(B)  $5\text{ kJ/kg}$

(C)  $2.5\text{ kJ/kg}$

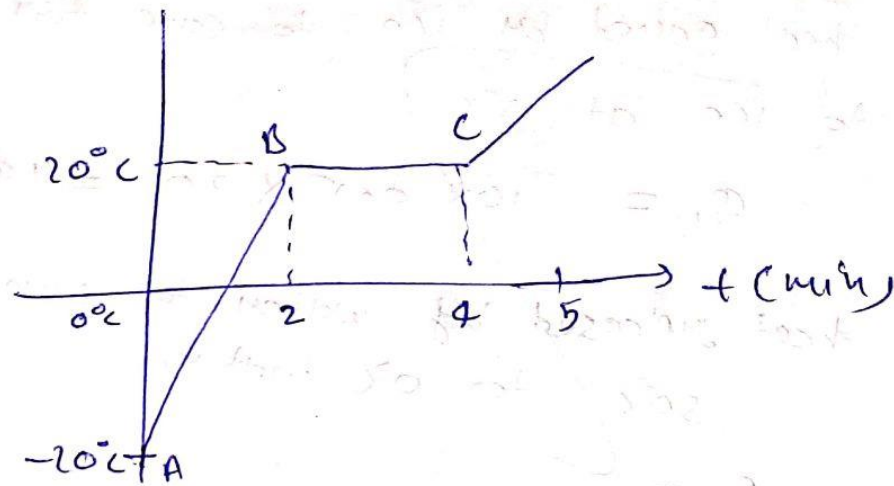

(D)  $7.5\text{ kJ/kg}$

Join Unacademy PLUS Referral Code :

Physicslive

Ans. B

In process B to C substance is changing its state from solid to liquid.

$\therefore$  Latent heat of fusion = ~~energy~~ energy gained  
in time  $t = 2 \text{ min}$   
to  $t = 4 \text{ min}$   
( $\Delta t = 2 \text{ min}$ ) for  $1 \text{ kg}$ .

$$(L) \text{ Latent heat of fusion} = \frac{5 \text{ kJ/min} \times 2 \text{ min}}{2 \text{ kg.}}$$

$$= \frac{10}{2} \text{ kJ/kg.}$$

$$\boxed{L = 5 \text{ kJ/kg}}$$

Q) An earthen pitcher loses 1 gm of water per minute due to evaporation. If the water equivalent of pitcher is 0.5 kg and pitcher contains 9.5 kg of water, calculate the time required for the water in pitcher to cool to  $28^{\circ}\text{C}$  from original temperature of  $30^{\circ}\text{C}$ . Neglect radiation effects. Latent heat of vaporization in this range of temperature is 580 Cal/gm and specific heat of water is 1 Cal/gm $^{\circ}\text{C}$ .

(A) 30.5 min

(C) 41.2 min

(B) 38.6 min

(D) 34.5 min

**Join Unacademy PLUS Referral Code :**

**Physicslive**

Ans. D

water equivalent of pitcher = 0.5 kg

$$\text{mass of water \& pitcher} = 9.5 + 0.5 \\ = 10 \text{ kg}$$

heat to be extracted from (water + pitcher)  
for decreasing its temperature from  
30°C to 28°C is:

$$Q_1 = 10 \times 1 \times (30 - 28)$$

$$Q_1 = 10 \times 1 \times 2$$

$$Q_1 = 20 \text{ kcal}$$

Heat extracted from the pitcher through  
evaporation in  $t$ -minutes.

$$Q_2 = mL$$

mass evaporated in time  $t$  will be  
 $m = 1 \times t = t \text{ gm.}$

$$Q_2 = t \times 580 \text{ cal}$$

$$Q_1 = Q_2$$

$$20 \times 10^3 \text{ cal} = t \times 580 \text{ cal}$$

$$t = 34.48 \text{ min}$$

$$\boxed{t \approx 34.5 \text{ min}}$$

Q) A mixture of 250 gm of water and 200 gm of ice at  $0^{\circ}\text{C}$  is kept in calorimeter of water equivalent 50 gm. If 200 gm of steam at  $100^{\circ}\text{C}$  is passed through the mixture then the final amount of water in the mixture will be (Latent Heat of ice = 80 cal/gm, latent Heat of vaporisation of water = 540 cal/gm and specific heat of water = 1 cal/gm $^{\circ}\text{C}$ ) -

(A) 450 gm

(C) 622 gm

(B) 572 gm

(D) 650 gm

**Join Unacademy PLUS Referral Code :**

**Physicslive**

Ans. B

water  
250 gm  
(+ 50 gm.  
of water  
equivalent of  
calorimeter)  
 $250 + 50 = 300 \text{ gm}$   
at  $0^\circ\text{C}$

ice  
200 gm  
at  $0^\circ\text{C}$

steam.  
200 gm.  
at  $100^\circ\text{C}$

heat gained by ice to converted into water at  $0^\circ\text{C}$

$$Q_1 = 200 \times 80 = 16,000 \text{ cal}$$

heat gained by water + calorimeter to rise  
its temp from  $0^\circ\text{C}$  to  $100^\circ\text{C}$

$$\text{Total mass of water} = 300 + 200 = 500 \text{ gm}$$

$$Q_2 = 500 \times 1 \times (100)$$

$$Q_2 = 50,000 \text{ cal}$$

$$\text{Total heat gained} = Q = Q_1 + Q_2 = 66,000 \text{ cal}$$

Let 'm' mass of steam is converted in  
water at  $100^\circ\text{C}$

$$\text{So, } m \times 540 = 66,000 \text{ cal}$$

$$m = 122.22 \text{ gm.}$$

$\therefore$  122 gm of 200 gm steam is converted  
into water

$$\therefore \text{Total mass of water} = 500 + 122$$

$$= 622 \text{ gm.}$$

but in 622 gm 50 gm is of  
water equivalent of calorimeter

$$\therefore \text{Total mass of water} = 622 - 50$$

$$= 572 \text{ gm.}$$

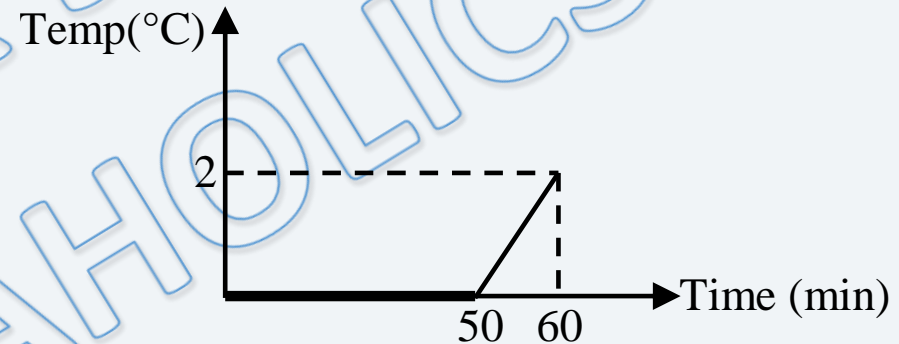

Q) A bucket contains a mixture of water and ice and total mass of content is 10 kg. Now this mixture is provided heat at uniform rate. The temperature Vs time graph is plotted. The initial amount of ice in the bucket will be [specific heat of water =  $4.2 \text{ kJ/kg-K}$  and latent heat of ice =  $340 \text{ kJ/kg}$ ] -

(A) 1.2 kg

(B) 2.4 kg

(C) 5 kg

(D) 3.6 kg

Join Unacademy PLUS Referral Code :

Physicslive

Ans. A

let; mass of water =  $m_1$

mass of ice =  $m_2$

$$m_1 + m_2 = 10 \text{ kg.}$$

let; rate of heat =  $x$  J/min.

then heat gained by ice in  
 $t = 50$  min (to convert in water)

$$= x \times 50 = 50x \text{ J.}$$

$$m_2 \times L = 50x$$

$$m_2 \times 340 = 50x$$

$$\boxed{m_2 = \frac{50x}{340} \text{ kg}}$$

for  $t = 50$  to  $t = 60$

$$\Delta t = 10 \text{ min}$$

in these 10 minutes heat gained by  
water is =  $10 \times x = 10x \text{ J.}$

rise in temp =  $2^\circ\text{C}$

$$(m_1 + m_2) \Delta T = 10x$$

$$10 \times 4.2 \times 2 = 10x$$

$$\boxed{x = 8.4} \text{ J/min}$$

$$\text{So; } m_2 = \frac{50}{340} \times 8.4$$

$$\boxed{m_2 = 1.23 \text{ kg}}$$

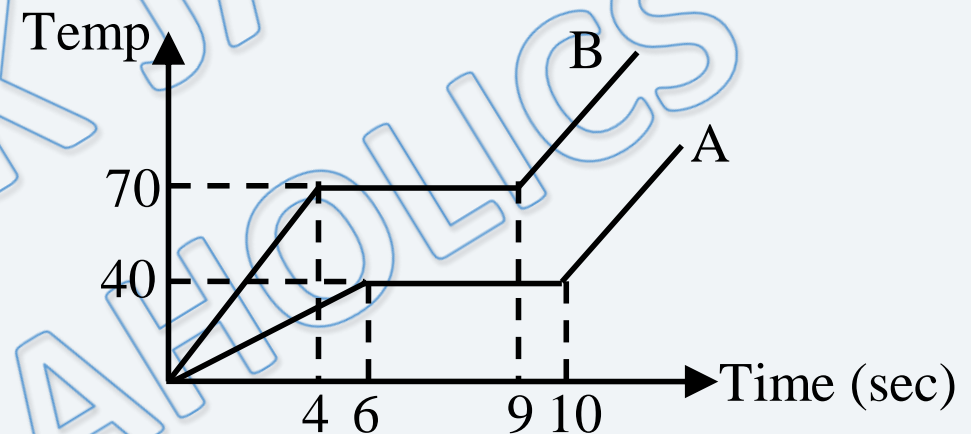

Q) Two solid bodies of equal masses are heated at the same rate under identical condition. The change in temperature is shown graphically as a function of time. The ratio of specific heat in solid form should be ( $S_A/S_B$ ) -

(A)  $4/3$

(B)  $15/8$

(C)  $21/8$

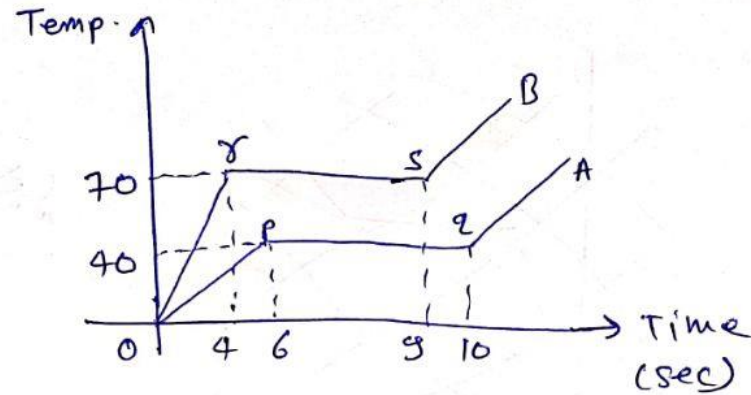

(D)  $3/4$

Join Unacademy PLUS Referral Code :

Physicslive

Ans. C

Let mass of bodies =  $m$  [let ~~the~~ the rate of heat gain =  $x \text{ J/s}$ ]  
 $\Rightarrow$  melting point of A =  $40^\circ\text{C}$   
 melting point of B =  $70^\circ\text{C}$

for A

time in of state  
(solid state)

6 sec.

Energy/heat  
gained =  $6x \text{ J}$ .

$$6x = m S_A (40 - 0) \quad \text{--- (1)}$$

for B

time in 'cr'stalline'  
(solid state) = 4 sec

Energy/heat gain =  $4x \text{ J}$ .

$$4x = m S_B (70 - 0) \quad \text{--- (2)}$$

$$\frac{(1)}{(2)} \Rightarrow \frac{6x}{4x} = \frac{m S_A (40)}{m S_B (70)}$$

$$\Rightarrow \frac{3}{2} = \frac{S_A}{S_B} \times \frac{4}{7}$$

$$\boxed{\frac{S_A}{S_B} = \frac{21}{8}}$$

Q) A body of mass 25 kg is dragged on a rough horizontal floor for one hour with a speed of  $2 \text{ kmh}^{-1}$ . The coefficient of friction for the surface in contact is 0.5 and half the heat produced is absorbed by the body. If specific heat of body is  $0.1 \text{ cal g}^{-1} (\text{°C}^{-1})$  and  $g = 9.8 \text{ ms}^{-2}$ , then the rise in temperature of body is:

(A) 39 K

(C) 59.5 K

(B) 84.5 K

(D) 11.6 K

**Join Unacademy PLUS Referral Code :**

**Physicslive**

Ans. D

$$\text{Heat Produced} = |\text{work done by friction}| = (\mu mg)(vt)$$

$$\text{Heat absorbed} = \frac{1}{2} \mu mg vt$$

$$\Delta Q = mc \Delta T = \frac{\mu mg vt}{2} \Rightarrow \Delta T = \frac{\mu g vt}{2c}$$

$$\Delta T = \frac{5 \times 9.8 \times 2 \times 5 \times 3600}{2 \times 1 \times 42 \times 10^3} = \frac{25 \times 98 \times 200}{42 \times 1000}$$

$$= \frac{350}{30} = 11.6^\circ \text{C}$$
