 $\therefore E_{\text{th}} = 6.63 \times 10^{-34} \times 1.13 \times 10^{17} = 7.5 \times 10^{-17} \text{ J}$

$E_{\text{incident}} = \frac{hc}{\lambda} = \frac{6.63 \times 10^{-34} \times 3 \times 10^8}{15 \times 10^{-10}} = 1.32 \times 10^{-16} \text{ J}$

5.

Sol. According to planck's quantum theory, EM radiations consist of packets of energy and by Einstein's explanation one electron absorbs only one packet of energy and if the energy is not sufficient to excite an electron from a metal surface then no photo electric emission is observed. Since the 2 photons of red Light do not have the required energy, hence the observation.

Let 1 normal 'O' atom has zero energy
 Then other oxygen atom has = (1.967 + 0) eV
